ECD - Exploring Cities through User-Generated Data

**Supervisor:** Aristides Gionis

**Contact information:** aristides.gionis@aalto.fi

**Job description:** Data shared on location-based social networks (e.g., Foursquare, Flickr) provide rich information about how citizens spend their time in different areas of their cities. They tell us, for example, what venues (restaurants, malls, museums, etc) are popular in different areas of a city, and at what time of the day. That information can then be used to understand better the life in cities, or provide recommendations for tourists.

The goal of this project is to design new algorithms for mining the activity of people in cities, and allow citizens to explore and enjoy their cities.
